PLATFORM BROCHURE

NEXAPAIR UAE · NOVEMBER 2026

Every third party, verified and in view

NexaPair is the third-party risk platform for UAE institutions: verify the companies you depend on, find the links nobody declared, monitor them between reviews and keep the evidence a regulator expects.

AT A GLANCE

Who it is for: banks, insurers, exchange houses, VASPs, DIFC and ADGM firms, government entities and the companies that supply them.

Where it runs: Microsoft Azure UAE North, so records can stay in the country.

Languages: the full interface in Arabic, right to left, and English.

Procurement, finance, legal, compliance and risk work on one record for each third party. Photo: Pexels.

INTRODUCTION

> *Third-party risk management is the work of knowing, checking and watching the companies you rely on, from the day you consider them to the day you leave them, and keeping proof that you did.*

Every institution in the UAE depends on outside companies: cloud and software providers, payment processors, outsourced operations, agents, intermediaries and suppliers. Each relationship brings risk the institution still owns: fraud, sanctions exposure, disruption, data loss and conflicts of interest.

NexaPair brings that work into one place. Every third party has one record from onboarding to exit; every check, finding and decision is kept with its evidence; and the register, Board pack and regulator notices come from live data instead of spreadsheets rebuilt each quarter.

15 modules on one vendor record

7 UAE regimes in requirement packs

2 languages: Arabic and English

6 wk typical plan from kickoff to first vendors live

01

THE CHALLENGE

Why third-party risk is harder than it looks

The risk sits outside your walls, but the accountability does not. Regulators now expect evidence, not intentions.

IN BRIEF

- A clean vendor at onboarding can be sanctioned, sued or breached next month.
- Fraud hides in shared details that nobody sees one record at a time.
- Seven UAE regimes each set their own outsourcing, incident and data rules.
- Supervisors test the trail: who decided, on what evidence, and when.

01 · RISK MAP

Eight kinds of third-party risk, one record

Third parties bring risk in many forms. NexaPair keeps each of them on the same vendor record, so one finding can move one score.

Regulatory and compliance	• Outsourcing without approval • Missing audit and access terms • Late incident notices	**Regime packs, contract checks and incident clocks**
Sanctions and financial crime	• Sanctioned owners or counterparties • Payments to the wrong account • Shell suppliers	**TFS screening, IBAN owner checks, NexaGraph**
Conflicts of interest	• Staff who own or run a supplier • Related-party dealings • Undeclared links	**Employee register matched to every supplier**
Cyber and information security	• Spoofed email and invoice fraud • Weak certificates and headers • Data held offshore	**NexaCybe grades and data-location records**
Financial	• Insolvency or distress • Over-dependence on one provider • Input VAT at risk	**Monitoring by tier, concentration views, NexaVatVeri**
Operational and resilience	• Outage at a critical provider • Recovery slower than tolerance • No tested exit	**Critical operations map and exit plans**
Concentration and fourth parties	• Shared subcontractors • Single points of failure • Hidden dependencies	**Dependency map and subcontractor register**
Reputational	• Adverse media • Litigation • Regulatory actions	**Adverse media, litigation and regulatory alerts**

WHY ONE RECORD MATTERS

Each of these risks is visible on its own. NexaPair connects them, so a sanctions hit, a shared phone number and a grade drop at the same supplier add up to one decision.

01 · CHALLENGES AND RESPONSES

From the problem to the answer

THE CHALLENGE	HOW NEXAPAIR RESPONDS
A supplier's trade licence can be fake or lapsed, its TRN invented, and the bank account on its invoice someone else's. Checking each by hand is slow, and the evidence is rarely kept.	**NexaVerify** Know who you are paying before anyone signs.
Fraud and conflicts hide in shared details: the same phone, bank account or director behind two suppliers, or an employee who quietly owns a vendor. Nobody sees them one record at a time.	**NexaGraph** Find the links nobody declared.
A vendor that was clean at onboarding can be sanctioned, sued or breached next month. Regulators expect ongoing monitoring and notices within hours, not an annual review.	**NexaSentinel** Hear about it first, and meet every clock.
Under FTA Decision No. 13 of 2026, input VAT is at risk unless you verified the supplier and the supply. That means checks every 12 months, thresholds by amount, and evidence you can hand to the FTA.	**NexaVatVeri** Protect your input VAT under the FTA's supplier checks.
Most supplier fraud starts with a spoofed email or a weak website. You cannot audit every vendor's security, but you can see what they show the internet and act on it.	**NexaCybe** An outside-in cyber grade for every vendor.
Obligations live in many instruments, entities and spreadsheets. When a rule changes, nobody is sure which controls, owners and policies it touches, or whether they were tested.	**NexaComply** Compliance management for any country's laws, with the UAE pre-loaded.

QUESTIONS TO START WITH

01 Could you show an examiner, today, the evidence behind your five most critical providers?

02 Which of your suppliers share a phone number, bank account or director with each other, or with your staff?

03 If a critical vendor went down at 9 am, who would start the four-hour clock, and how would you prove the time?

04 When did the Board last see one register of every outsourced activity?

02

THE PLATFORM

One vendor record, from onboarding to exit

Fifteen modules share a single record for each third party, so a check done once is reused everywhere and every decision keeps its evidence.

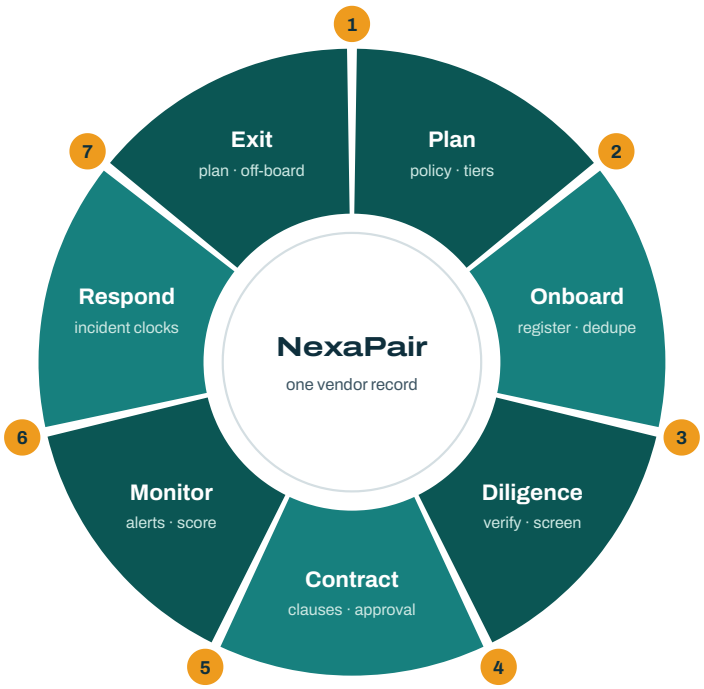

IN BRIEF

- Verify at the source before anyone signs or pays.
- Find the links between suppliers and your own staff.
- Monitor by risk tier and meet every regulator's clock.
- Produce the register, notices and Board pack from live data.

02 · FRAMEWORK

The third-party lifecycle, end to end

Seven stages, one record. Each stage leaves evidence that the next one can rely on.

Stage	Where	What happens
1. Plan	NexaComply, regime packs	Board-approved policy, risk model, tiers and approval chains
2. Onboard	NexaVerify	Intake wizard with duplicate checks; supplier questionnaire in Arabic or English
3. Diligence	NexaVerify, NexaGraph, TFS	Licence, TRN, beneficial owners, IBAN, sanctions and links to staff
4. Contract	Contracts, regime packs	Clause checklist, non-objection gate, register entry
5. Monitor	NexaSentinel, NexaCybe, NexaScore	Re-screening by tier, cyber grades, alerts with owners and dates
6. Respond	NexaSentinel, outputs	Incident clocks per regulator; notices drafted from records
7. Exit	Resilience, outputs	Exit plans, substitutability, off-boarding and data return

WHY IT MATTERS

Because every stage writes to the same record, the register, the Board pack and each regulator notice are produced from what actually happened, not rebuilt by hand.

What the lifecycle produces

Register of outsourced activities

Every arrangement with its criticality, data location, contract dates and exit status.

Board pack

Risk by tier, open alerts, exceptions and decisions, ready for the committee.

Regulator notices

First notice, summary and return to normal, with each due time counted from detection.

02 · WORKFLOW

How an onboarding moves through the platform

Five people, seven steps, one record. Each hand-off is logged, and nothing is approved before it is verified.

Separation of duties: the person who raises a decision is not the person who approves it, and both are recorded.

Nothing skipped

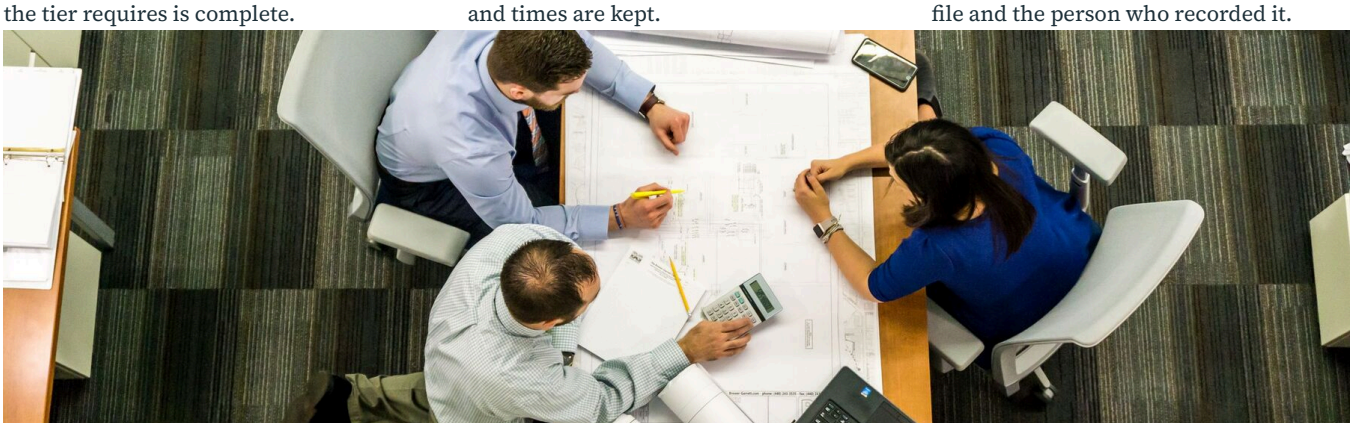

Approval waits until the due diligence the tier requires is complete.

Maker and checker

A second person approves; both names and times are kept.

Dated evidence

Every check stores its source, method, file and the person who recorded it.

Each department does a small, clear part of the work, on the same record. Photo: Pexels.

02 · KEY FEATURES

Ten things NexaPair does for you

Each feature works on the same vendor record, in Arabic and English, with an audit trail behind every change.

Verification at the source

Trade licence, TRN format and FTA record, beneficial owners at 25% or control, IBAN structure and owner.

Relationship analysis

Tax IDs, IBANs, UAE phone formats and fuzzy names matched across suppliers and your employee register.

Monitoring by tier

Sanctions, adverse media, PEP, litigation and regulatory actions re-screened on a cycle from 180 days to 7.

Incident clocks

Clocks start when an event is recorded, per regulator, with the notice drafted from the record.

NexaScore

A 0 to 100 risk score built from weighted factors you can see, adjust and explain.

Seven UAE regimes

Requirement packs for CBUAE, DFSA, FSRA, CMA, VARA, government and federal law.

Outside-in cyber grades

A passive A to F grade per vendor from email security, certificates and headers.

FTA supplier checks

Supplier and supply checks under FTA Decision No. 13 of 2026, with input VAT held until cleared.

Regulator outputs

Register of outsourced activities, Board pack and notices generated from live data.

Open integration

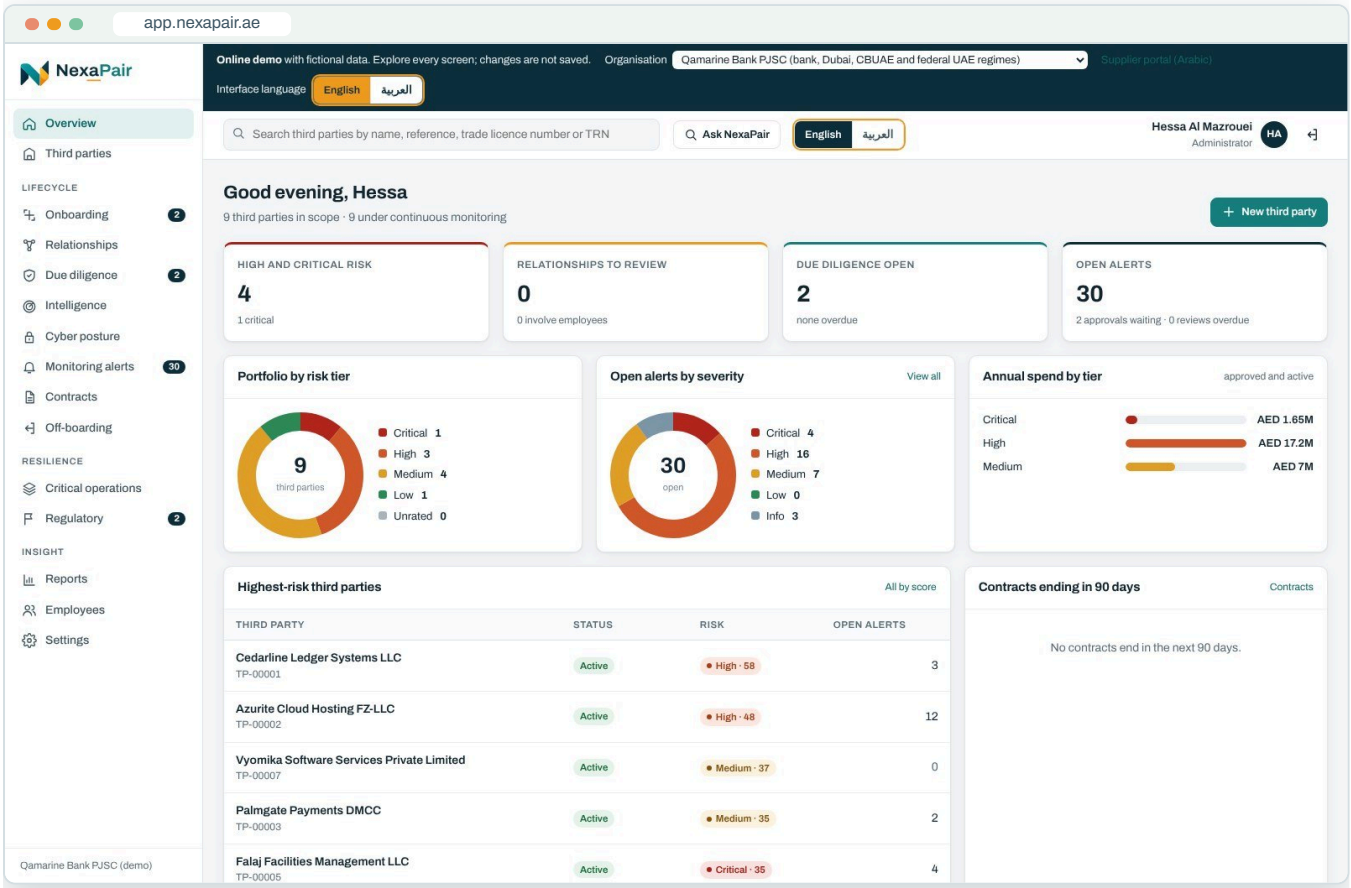

REST API, signed webhooks and CSV or JSON exports today; native ERP connectors on the roadmap.

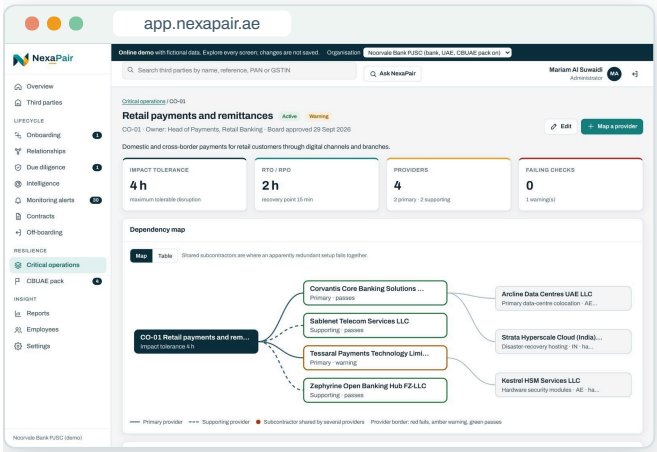

Every finding lands in a score you can explain to an examiner. Photo: Pexels.

03 · INSIDE NEXAPAIR

See your whole portfolio at once

Overview: third parties by risk tier, open alerts by severity, annual spend by tier and contracts ending in the next 90 days. Real NexaPair screen; all organisations and data shown are fictional.

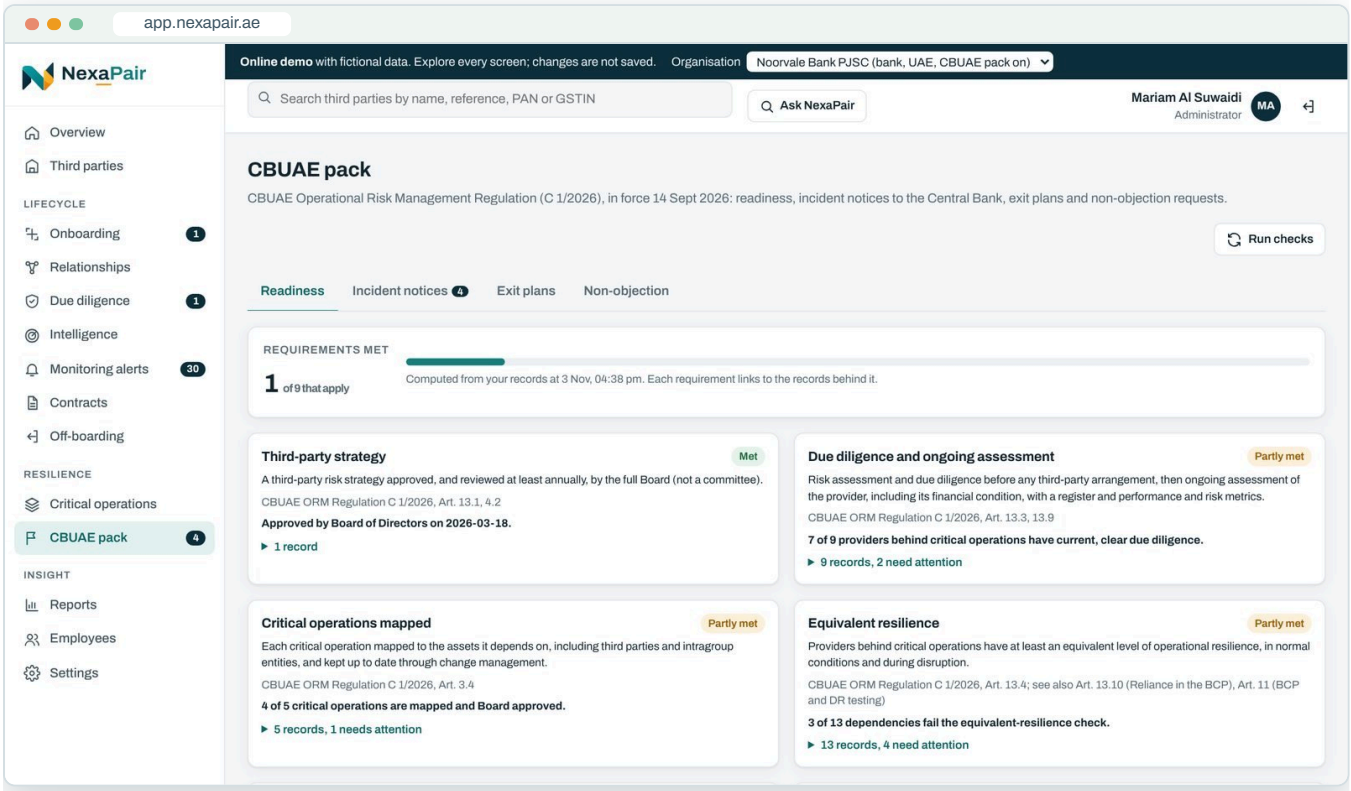

Critical operations: each operation mapped to the providers and subcontractors behind it, with tolerance and recovery times. Real NexaPair screen; all organisations and data shown are fictional.

What you see on day one

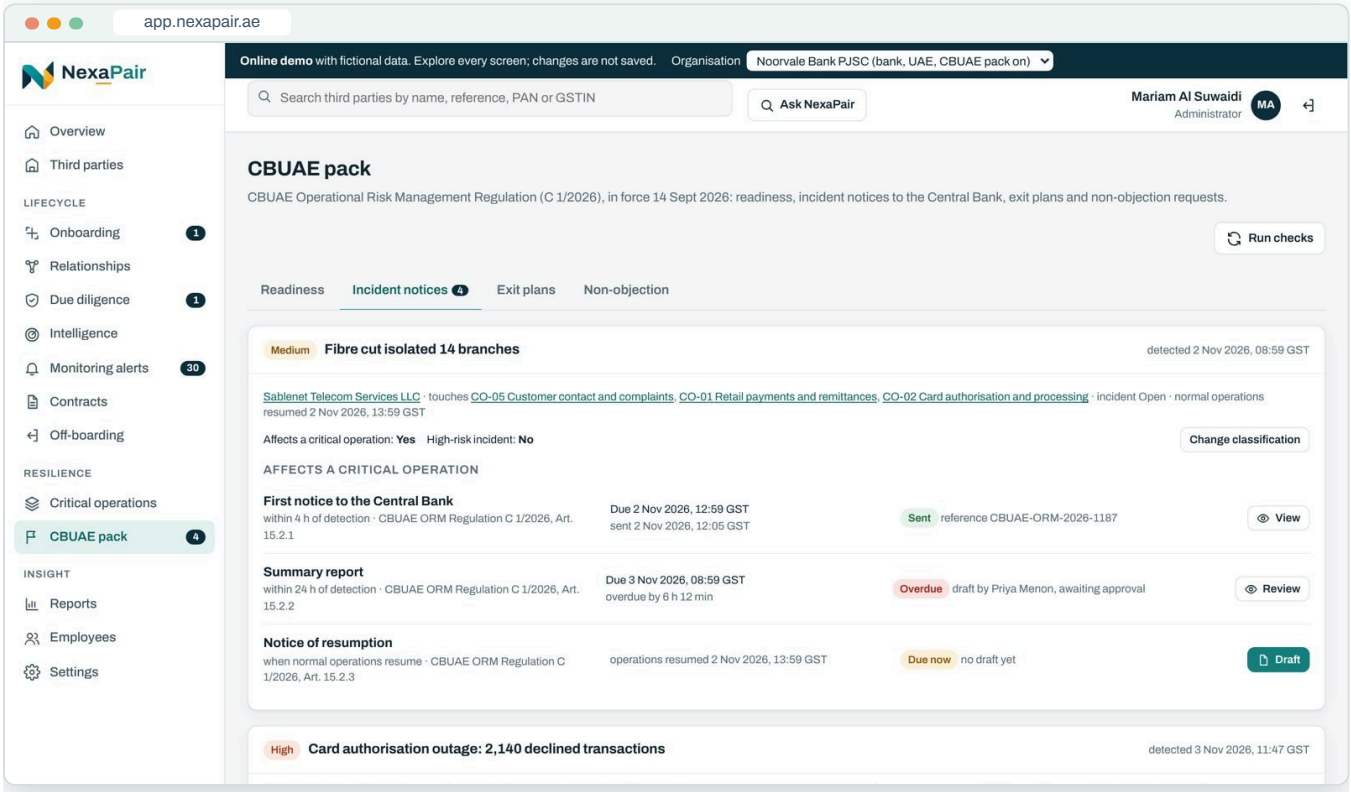

- Which third parties are high or critical risk, and why.
- Alerts waiting, with owner and due date.
- Shared subcontractors behind an apparently redundant set-up.
- Contracts ending soon, so exits are planned, not rushed.

03 · REGULATOR-READY

Evidence before anyone asks

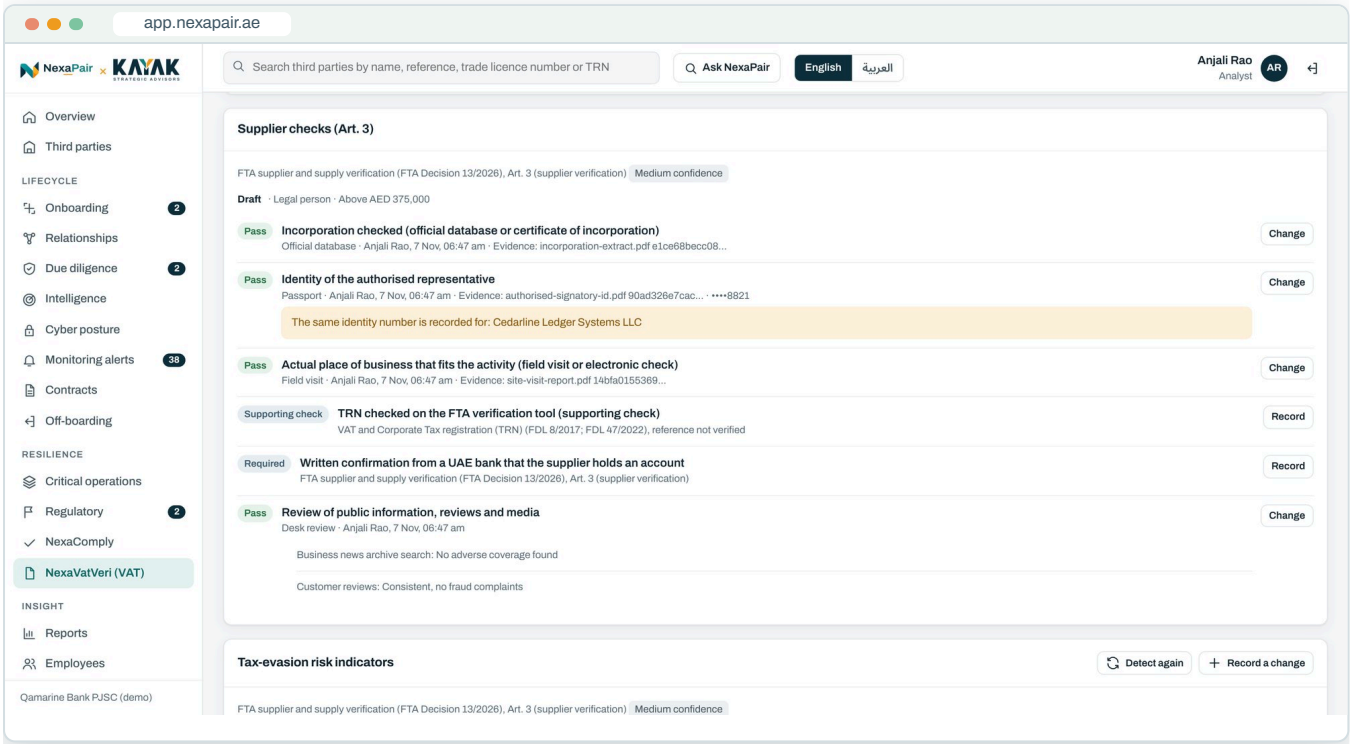

CBUAE pack, Readiness: each requirement of Regulation C 1/2026 computed from your records, with links to the records behind it. Real NexaPair screen; all organisations and data shown are fictional.

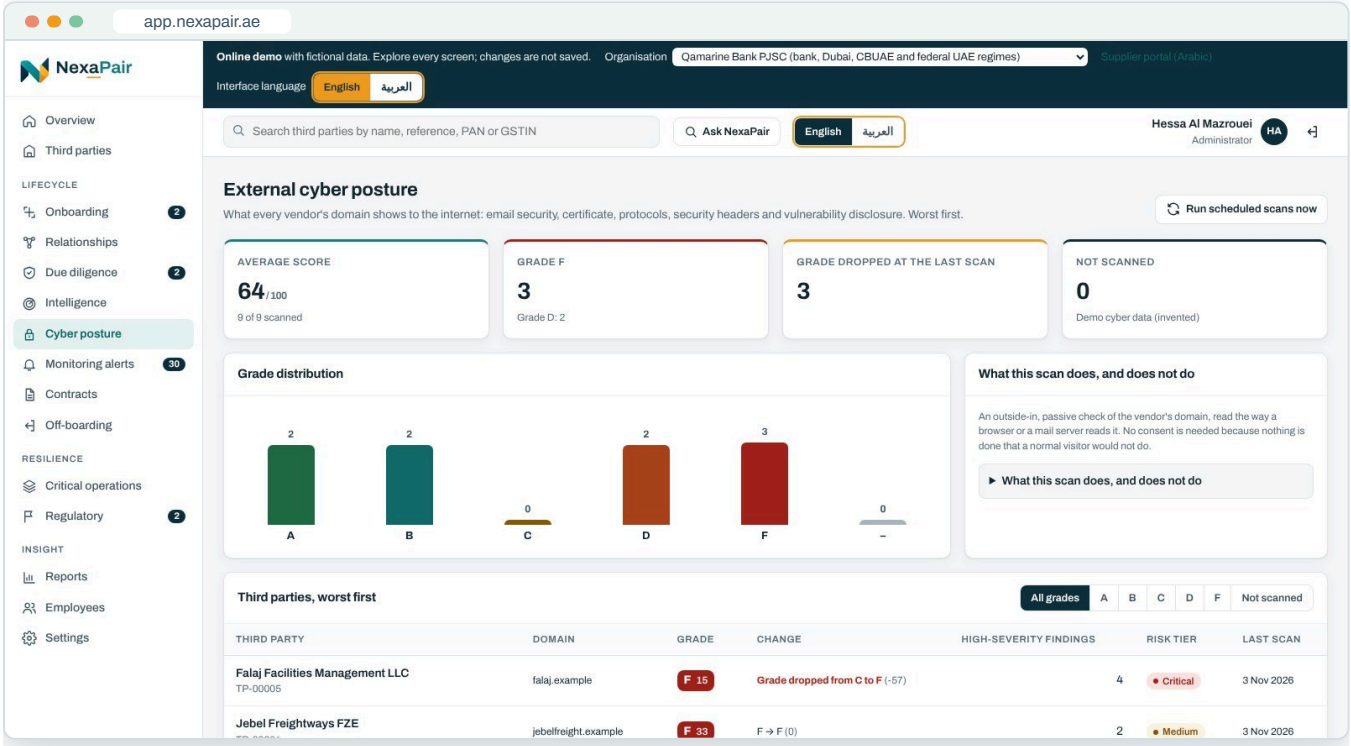

CBUAE pack, Incident notices: the first notice, summary and return-to-normal notice for each event, with due times in GST. Real NexaPair screen; all organisations and data shown are fictional.

03 · TAX AND CYBER

Input VAT protected, vendors graded

NexaVatVeri: the supplier checks that apply under FTA Decision No. 13 of 2026, each with method, evidence and who recorded it. Real NexaPair screen; all organisations and data shown are fictional.

NexaCybe: an outside-in grade for each vendor, the grade distribution and the vendors whose grade dropped. Real NexaPair screen; all organisations and data shown are fictional.

NexaVatVeri records verification; it does not guarantee compliance or that input VAT will be recovered. NexaCybe scans passively: no port scanning, no probing.

03 · NEXASCORE

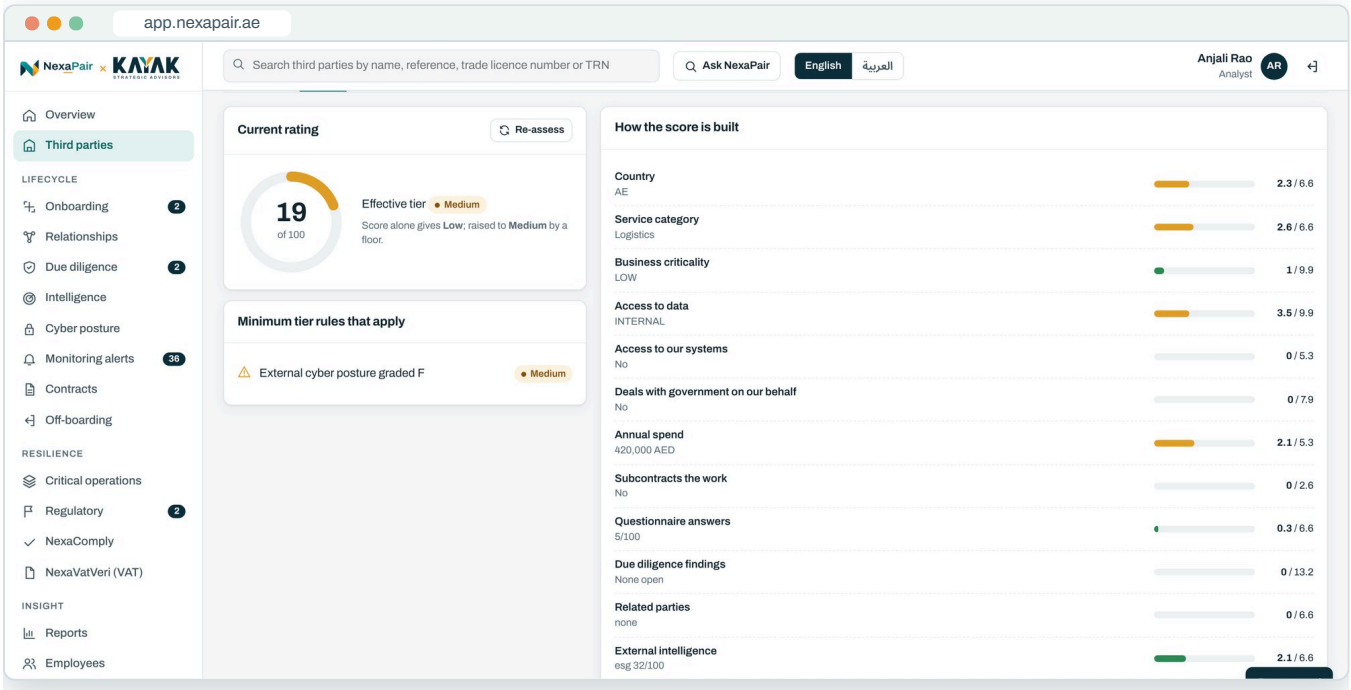

A risk score you can explain

NexaScore turns twelve factors into one score from 0 to 100. The default weights are below; each organisation can change them, and every score shows how it was built.

Due diligence findings	20	Questionnaire answers	10
Business criticality	15	Related parties	10
Access to data	15	External intelligence	10
Dealings with government	12	Access to systems	8
Country	10	Annual spend	8
Service category	10	Subcontracting	4

Default factor weights from the NexaPair risk model. An optional external cyber posture factor is off by default (weight 0).

How the score is built: each factor, what it scored and its weight, for one fictional supplier. Real NexaPair screen; all organisations and data shown are fictional.

From score to tier

Low	Medium	High	Critical
0 to 24	25 to 44	45 to 64	65 to 100

Default thresholds. The tier sets due diligence depth, monitoring frequency and the approvals a decision needs. Minimum-tier rules can lift a tier, for example when a critical operation depends on the vendor.

04 · SOLUTIONS AND PLANS

Start with one problem, or take the platform

Six solutions are sold on their own, each with NexaScore. NexaPair UAE brings every module and every UAE regime pack together under one contract.

NexaVerify

Know who you are paying before anyone signs.

- No vendor is approved before it is verified
- Payments are not diverted to an account in someone else's name
- A dated evidence file for every check
- Hours of manual checking cut to minutes

NexaGraph

Find the links nobody declared.

- Undeclared conflicts found before contracts are awarded
- Shell suppliers and split invoices exposed
- A defensible record of each decision
- Audit findings prevented, not just reported

NexaSentinel

Hear about it first, and meet every clock.

- Problems found before your regulator or the press finds them
- Every deadline counted from detection
- Review frequency that follows risk
- Less noise: a person confirms what matters

NexaVatVeri

Protect your input VAT under the FTA's supplier checks.

- Input VAT deductions you can defend
- Checks done once, reused across invoices
- An audit answered in hours, not weeks
- Fewer penalties and denied refunds

NexaCybe

An outside-in cyber grade for every vendor.

- Weak vendors found before they are breached
- Invoice-fraud risk cut at the source
- Evidence for your ICT third-party controls
- No questionnaire needed to get started

NexaComply

Compliance management for any country's laws, with the UAE pre-loaded.

- One register of obligations across the group
- Proof that controls were tested, not just written
- Regulatory change handled before the deadline
- A status the Board can read at a glance

NexaPair UAE

The full third-party risk platform for the UAE, with the FTA rules built in.

- One platform instead of seven spreadsheets
- Examiner-ready evidence, any day
- UAE data residency in a UAE cloud region
- Grow from one solution to all without migration

In every plan

- Arabic and English interface
- One vendor record, audit trail and exports
- Single sign-on, MFA and role-based access
- UAE cloud region

Every plan is quoted for your vendors, regimes and users. The order form is what binds.

Payments providers are among the most critical third parties a bank has. Photo: Pexels.

ILLUSTRATION ONLY

This is a fictional scenario showing how the platform works. Qamarine Bank PJSC and every company in it are invented; it is not a client case study and implies no result.

05 · WORKED EXAMPLE

A card processor at Qamarine Bank (fictional)

How one onboarding runs through NexaPair, from the first request to the first incident.

Day 1 — **Request**

The head of payments asks Procurement to onboard a card processor. The intake wizard finds no duplicate.

Day 2 — **Verify**

NexaVerify checks the trade licence and TRN. The IBAN on the first invoice belongs to a different company name: an alert opens.

Day 3 — **Connect**

NexaGraph finds the processor shares a phone number with a company owned by a bank employee. The link is confirmed and the conflict declared.

Day 5 — **Score**

NexaScore places the processor in the High tier. A minimum-tier rule applies because it supports a critical operation.

Day 8 — **Approve**

Legal confirms audit and Central Bank access clauses. The approver signs off; the non-objection gate stays closed until the letter is filed.

Later — **Respond**

An outage at the processor is recorded at 09:12 GST. The four-hour clock starts and the first notice is drafted from the record.

WHAT THE EXAMPLE SHOWS

Two problems that sit in different teams, a payment detail and a staff conflict, surfaced before signature, on one record, with the evidence attached.

06 · SECURITY

Security, stated plainly

We state what is true today. Controls are aligned to ISO/IEC 27001 and SOC 2; certification is not yet held, and we do not claim it.

UAE cloud region

Production runs in Microsoft Azure UAE North.

Five roles

Role-based access; API keys scoped the same way.

SSO and MFA

Entra ID, Okta, AD FS, any OIDC or SAML 2.0; codes, passkeys and recovery codes.

Audit trail

Who changed what, and when; exportable at any time.

People decide

Personal data is removed before any call to an outside AI model.

Scanned on every change

Code, dependency, secret, container and web scanning.

READ MORE
